

Linux Administration Lab Project

Author: Samuel Ijidele

Overview

This project demonstrates basic Linux system administration skills in a virtual environment. It covers user management, permissions, package installation, process monitoring, and log analysis.

Environment

- Ubuntu Linux (Virtual Machine)
- VirtualBox / VMware

Tasks Performed

- Created and managed users
- Modified file permissions and ownership
- Installed and updated packages
- Monitored system processes
- Reviewed system logs

Commands Used

```
sudo adduser samuel
chmod 755 file.txt
chown user:user file.txt
sudo apt update && sudo apt upgrade
ps aux
top
cat /var/log/syslog
```

Key Learnings

- Understanding Linux permissions and user roles
- Monitoring system performance
- Basic troubleshooting using logs
- Performing essential admin tasks

Conclusion

This lab provides foundational Linux skills necessary for cybersecurity and system administration roles.
